Programming cable for LS-type radios

We would like to explain how to program the radios with the LS-type connector such as the IP100H, IP501H, IP503H and the IC-F200 series. **Conclusion: Use the OPC-478UC-1 or the OPC-478UC marked with "B" and the OPC-2144.**

There are several different types of audio accessories connectors using 3.5mm but the latest LS type connector is the smallest in shape (surrounding mold). Non-LS compatible ones cannot fit well. This makes LS type connector radios work only with the specific programming cable.

There are five generations of the 3.5mm connector type programming cables but only the latest one (OPC-478UC-1) can be used as well as the previous OPC-478UC (marked with "B"). Both cables must be used together with the OPC-2144 to fit. Any other older cables (OPC-478/U/UC without "B") will not work due to expired OS / device driver support and physical shape difference in surrounding mold.
